interrupt/exception handler of Tapestry operating system:

// Control vectors here when a synchronous exception or asynchronous interrupt is to be
// exported to / manifested in an x86 machine.

// The interrupt is directed to something within the virtual X86, and thus there is a possibility
// that the X86 operating system will context switch. So we need to distinguish two cases:
// either the running process has only X86 state that is relevant to save, or
// there is extended state that must be saved and associated with the current machine context
// (e.g., extended state in a Tapestry library call in behalf of a process managed by X86 OS)
if execution was interrupted in the converter - EPC.ISA == X86 {

// x86 instruction boundary. Then, if the rollback was induced by an asynchronous external
// interrupt, Taxi will deliver the appropriate x86 interrupt. Else, the rollback was induced
// by a synchronous event so Taxi will resume execution in the converter, retriggering the
// exception but this time with EPC.ISA == X86 } 353

// conditions and permits re-entry during long running routines (e.g. far call through a gate)
// to deliver external interrupts } 354

} else {

// This is the most difficult case - the machine was executing native Tapestry code on
// behalf of an X86 thread. The X86 operating system may context switch. We must save
// all native state and be able to locate it again when the x86 thread is resumed.
